

Defran Systems has partnered with a leading e-prescription provider, DigitalRX, to bring all the convenience and efficiency of electronic prescribing to Evolv-CS. Completely built in to the familiar interface of Evolv-CS, DigitalRX provides the latest in e-prescribing functionality.

Full Integration

All prescription records are pulled into the Evolv-CS Medication History section to create a centralized patient medication record.

Access to a Nationwide Database

Doctors have access to a vast drug library containing over 60,000 prescription drugs, with up to the minute information on drug-drug, drug-food, and drug-allergy warnings.

Additionally, a national pharmacy database allows the prescriber to search for retail, independent and mail-order pharmacies.

Prescription History

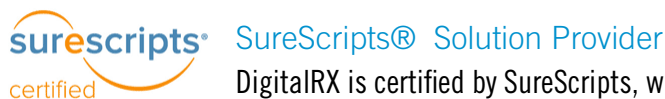

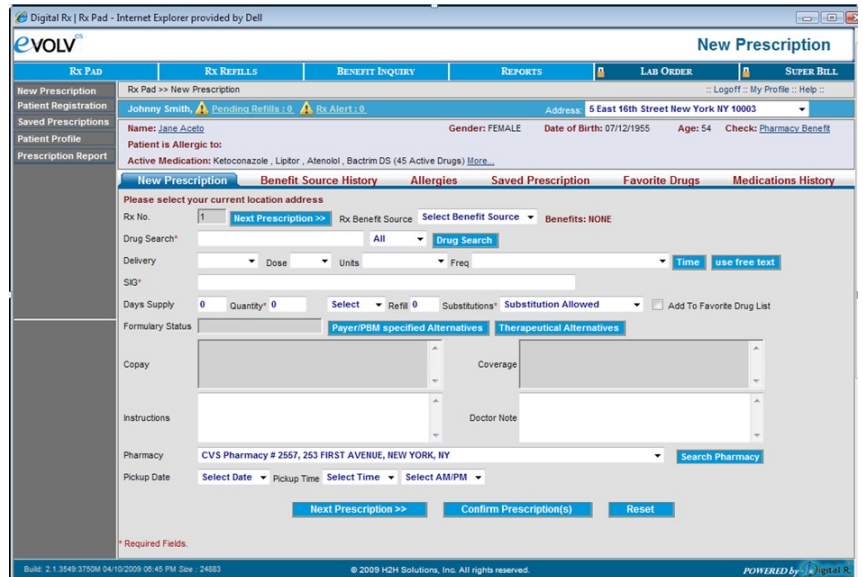

Prescribers can access a timely and clinically sound view of a patient's prescription history across providers at the point of care. This decreases the risk of preventable medication errors.

Prescription Benefit

The Prescription Benefit service puts eligibility, benefits and formulary information at the doctor's fingertips at the time of prescribing. This enables prescribers to select medications that are on formulary and are covered by the patient's drug benefit. It also informs them of lower cost alternatives such as generic drugs.

Prescription Routing

Prescription Routing replaces old, error-prone approaches to sending new prescriptions with the secure electronic exchange between prescribers and pharmacies, thereby reducing the risk of medication errors associated with poor handwriting, illegible faxes and manual data entry. It also saves time and money by dramatically reducing the number of phone calls and faxes typically associated with the prescription renewal authorization process.

Security and HIPAA Compliance

Physicians, PAs, RNs, LPNs, and Office Support Staff members are assigned different levels of access and authorization to the system.
